Research project at the University of Agder

Would you like to take part in the evaluation of ATLAS?

This is an invitation to try ATLAS, a research prototype for referrals to mental health care, and to say what you think of it. This letter explains what the evaluation involves and what taking part means for you.

For GPs and for clinicians who assess referrals at a DPS · Version 1, 18 October 2026

Purpose of the evaluation

The PhD project 'Clinical decision-making in mental health referrals' at the University of Agder studies how GPs and specialists at DPS (district psychiatric centres) make decisions about referrals, especially when a case is uncertain. Interviews with GPs and DPS specialists are the basis for ATLAS, a prototype of decision support for both sides of a referral.

ATLAS shows how uncertain a case is and which criteria a referral speaks to. It does not recommend what to do. The evaluation looks at how clinicians experience ATLAS: what is clear, what is useful, what gets in the way, and whether anything reads as advice. The answers are used to improve ATLAS and in the doctoral thesis.

Why are you being asked?

You are being asked because you are a GP, or because you assess referrals at a DPS. You can take part whether or not you were interviewed in the project.

What does taking part involve?

- You use ATLAS in a web browser on a computer, for about an hour. You can take a break and continue later in the same browser.
- You choose a role, GP or DPS, and get a short tour of ATLAS.
- You work through three fictional patient cases. You see each case first without ATLAS and then with ATLAS.
- Along the way you answer short forms in Nettskjema: about your role and work, about each case, about ATLAS as a whole, and a few closing questions. There are no right answers.
- GPs can also look at two short extra cases if they wish, and DPS clinicians at one short extra view. You can also give feedback on single screens. Both are optional.

All patients, messages and figures in ATLAS are fictional. Do not write information about real patients or other people in the forms.

Taking part is voluntary

You can stop whenever you like, without giving a reason, and you can skip forms you do not want to answer. This has no consequences for you.

You consent to take part by ticking ‘I have read the information letter and want to take part’ in the first form.

Want to withdraw the answers you have sent? Send your study name to the project leader, and every answer with that name will be deleted. The study name is shown at the top of every form. Answers already included in published results cannot be taken out of them.

Your privacy

- The evaluation is anonymous. ATLAS and the forms do not ask for your name, email, phone number or workplace, and you do not sign in.
- Your answers are kept together by a random study name, for example ‘Rolig elg 27’. ATLAS makes it in your browser when you choose a role. Nobody has a list that links study names to people.
- Each form automatically includes your role, the study name, which step it belongs to and which version of ATLAS you used.
- The answers are stored in Nettskjema, a service for secure data collection from the University of Oslo. Only the researchers in the project have access to them.
- ATLAS remembers how far you have come, only in your browser, so you can take a break. ATLAS has no analytics and no tracking. The site is hosted on GitHub Pages, which logs visitors' IP addresses for security purposes. The project has no access to them.
- If you use a computer that others also use, the next person can choose ‘Not you? Start as a new participant’ when ATLAS opens again, and get a study name of their own.

The results are published in the doctoral thesis and in scientific articles, as combined results and short, anonymous quotes from free-text answers.

Pilot round. Before the study starts, ATLAS is tried in a pilot round. Answers from the pilot round are marked as pilot and kept out of the study's data. While the pilot round runs, ATLAS shows ‘Pilot’ at the top.

What happens to the answers when the project ends?

The project is planned to end in January 2027. The answers are anonymous and may be kept after that, so the research can be checked.

Who is responsible?

The University of Agder is responsible for the project. The evaluation is carried out by PhD research fellow Jishnu Das, with the supervisors Geir Inge Hausvik and Carl Erik Moe. The project has been assessed by Data Protection Services at Sikt (reference 480551).
